VSD, no PDA, small PFO, post VSD closure: saline test- no TR, epicardial echocardiography- no residual shunt, mild TR, no MR, trivial AR, good LV function, pericardium closed completely, bilateral pleurae intact

Steps: Patient positioned and draped, median sternotomy, thymus split, vertical pericardiotomy, pericardial flaps, anatomy assessed, aortic pursestring, heparinisation, SVC pursestring, aortic and SVC cannulation, ACT checked, CPB on, IVC pursestring and cannulation. Aorta, FA dissected, ligamentum clipped, SVC, IVC looped, cardioplegia pursestring and cannulation. AoXCI, SVC, IVC snugged, and cardioplegia started. RA opened, PFO enlarged and LA vented through it, diastolic arrest, RA stays, anatomy assessed, ATL retracted, margins of VSD assessed, bovine pericardial patch taken and sized to appropriate size, VSD closed with pericardial patch in a continuous fashion. Interatrial septum closed after LA deairing, rewarming, AoXCI off, root vented, RA closure completed in 2 layers with deairing. CPB was gradually weaned off and pacing wires placed (1 RV, 1 RA). Sequential decannulation, protamine, haemostasis. Drains placed (1 retrocardiac and 1 retrosternal), pericardium closed completely, routine sternal closure with Ethibond. Layered closure of subcutaneous tissues and skin done. The patient was shifted to ICU in stable hemodynamics.

He received 1 unit of PRBC. Hemodynamics were stable on minimal inotropic support and routine investigations were unremarkable. After a successful weaning trial and achieving satisfactory blood gas levels, he was extubated on POD 0 and put on oxygen via nasal prongs. Chest physiotherapy was done. After extubation, he was maintaining satisfactory vitals. Per oral liquid diet started initially.
